How do you know what is redundant?

Functional Dependency

A **functional dependency** (**fd**) $X \to Y$ states that if the values of attributes X agree in two tuples, then so must the values in Y.

Using an FD to find a value

If the FD no $\to$ rate holds then x in the table below must always take the value 5.25, but y and z may take any value.

bank_data

no	mid	rate
101	1007	5.25
101	1008	x
119	1009	y
z	1010	5.25

Quiz 1: FDs that hold in bank_data

bank_data

no	sortcode	bname	cash	type	cname	rate?	mid	amount	tdate
100	67	Strand	34005.00	current	McBrien, P.	null	1000	2300.00	1999-01-05
101	67	Strand	34005.00	deposit	McBrien, P.	5.25	1001	4000.00	1999-01-05
100	67	Strand	34005.00	current	McBrien, P.	null	1002	-223.45	1999-01-08
107	56	Wimbledon	84340.45	current	Poulovassilis, A.	null	1004	-100.00	1999-01-11
103	34	Goodge St	6900.67	current	Boyd, M.	null	1005	145.50	1999-01-12
100	67	Strand	34005.00	current	McBrien, P.	null	1006	10.23	1999-01-15
107	56	Wimbledon	84340.45	current	Poulovassilis, A.	null	1007	345.56	1999-01-15
101	67	Strand	34005.00	deposit	McBrien, P.	5.25	1008	1230.00	1999-01-15
119	56	Wimbledon	84340.45	deposit	Poulovassilis, A.	5.50	1009	5600.00	1999-01-18

Which set of FDs below do not hold for the data?

A

no → rate
no → bname

B

no → type
bname → no

C

no → type
mid → bname

D

amount → rate
bname → sortcode

Quiz 2: Deriving FDs from other FDs

sortcode → bname
no → sortcode
no → cname
no → rate
mid → no

Given the FDs above, which FD below might not hold?

A

no → bname

B

no,sortcode → cname,sortcode

C

amount,tdate → amount

D

amount,tdate → mid

Armstrong's Axioms

X, Y and Z are sets of attributes, and XY is a shorthand for $X \cup Y$

Reflexivity

$Y \subseteq X \models X \rightarrow Y$

- Such an FD is called a **trivial** FD

Applying reflexivity

If amount,tdate are attributes
By reflexivity
$\text{amount} \subseteq \text{amount}, \text{tdate} \models \text{amount}, \text{tdate} \rightarrow \text{amount}$
$\text{tdate} \subseteq \text{amount}, \text{tdate} \models \text{amount}, \text{tdate} \rightarrow \text{tdate}$

Armstrong's Axioms

X, Y and Z are sets of attributes, and XY is a shorthand for $X \cup Y$

Augmentation

$X \to Y \models XZ \to YZ$

Applying augmentation

If no,cname,sortcode are attributes and no $\to$ cname
By augmentation
no $\to$ cname $\models$ no,sortcode $\to$ cname,sortcode

Armstrong's Axioms

X, Y and Z are sets of attributes, and XY is a shorthand for $X \cup Y$

Transitivity

$X \to Y, Y \nrightarrow Z \models X \to Z$

Applying transitivity

If no $\to$ sortcode and sortcode $\to$ bname
By transitivity
no $\to$ sortcode, sortcode $\to$ bname $\models$ no $\to$ bname

Union Rule

Armstrong's Axioms

Reflexivity: $Y \subseteq X \models X \to Y$

Augmentation: $X \to Y \models XZ \to YZ$

Transitivity: $X \to Y, Y \to Z \models X \to Z$

Union Rule

If $X \to Y, X \to Z$

By augmentation

$X \to Y \models XZ \to YZ$

$X \to Z \models X \to XZ$

By transitivity

$X \to XZ, XZ \to YZ \models X \to YZ$

If $X \to YZ$

By reflexivity

$YZ \models YZ \to Y, YZ \to Z$

By transitivity

$X \to YZ, YZ \to Y \models X \to Y$

$X \to YZ, YZ \to Z \models X \to Z$

$$\therefore X \to Y, X \to Z \equiv X \to YZ$$

- Note that the union rules means that we can restrict ourselves to FD sets containing just one attribute on the RHS of each FD without loosing expressiveness

Quiz 3: Deriving FDs from other FDs

Given a set $S = \{A \to BC, CD \to E, C \to F, E \to F\}$ of FDs

Which set of FDs below follows from S?

A

$A \to BF, A \to CF, A \to ABCF$

B

$A \to BD, A \to CF, A \to ABCF$

C

$A \to BD, A \to BF, A \to ABCF$

D

$A \to BD, A \to BF, A \to CF$

Pseudotransitivity Rule

Armstrong's Axioms

Reflexivity: $Y \subseteq X \models X \to Y$
Augmentation: $X \to Y \models XZ \to YZ$
Transitivity: $X \to Y, Y \to Z \models X \to Z$

Pseudotransitivity Rule

If $X \to Y, WY \to Z$
By augmentation
$X \to Y \models WX \to WY$
By transitivity
$WX \to WY, WY \to Z \models WX \to Z$

$$\therefore X \to Y, WY \to Z \models WX \to Z$$

Decomposition Rule

Armstrong's Axioms

Reflexivity: $Y \subseteq X \models X \to Y$
Augmentation: $X \to Y \models XZ \to YZ$
Transitivity: $X \to Y, Y \to Z \models X \to Z$

Decomposition Rule

If $X \to Y, Z \subseteq Y$
By reflexivity
$Z \subseteq Y \models Y \to Z$
By transitivity
$X \to Y, Y \to Z \models X \to Z$

$$\therefore X \to Y, Z \subseteq Y \models X \to Z$$

FDs and Keys

Super-keys and minimal keys

- If a set of attributes X in relation R functionally determines all the other attributes of R, then X must be a **super-key** of R
- If it is not possible to remove any attribute from X to form X', and X' functionally determine all attributes, then X is a **minimal key** of R

Determining keys of a relation

Suppose branch(sortcode, bname, cash) has the FD set
{sortcode → bname, bname → sortcode, bname → cash}

1. {sortcode, bname} is a super-key since {sortcode, bname} → cash
2. However, {sortcode, bname} is not a minimal key, since sortcode → {bname, cash} and bname → {sortcode, cash}
3. sortcode and bname are both minimal keys of branch

Quiz 4: Deriving minimal keys from FDs

Suppose the relation $R(A, B, C, D, E)$ has functional dependencies $S = \{A \to E, B \to AC, C \to D, E \to D\}$

Which of the following is a minimal key?

A	B	C	D
A	AB	BC	B

Quiz 5: Keys and FDs

Suppose the relation $R(A, B, C, D, E)$ has minimal keys AC and BC

Which FD does not necessarily hold?

A	B	C	D
$ABC \to DE$	$AC \to BDE$	$AB \to DE$	$BC \to DE$

Closure of a set of attributes with a set of FDs

Closure X^+ of a set of attributes X with FDs S

1. Set $X^+ := X$
2. Starting with X^+, apply each FD $X_s \rightarrow Y$ in S where $X_s \subseteq X^+$ but Y is not already in X^+, to find determined attributes Y
3. $X^+ := X^+ \cup Y$
4. If Y not empty goto (2)
5. Return X^+

Closure of attributes

Relation $R(A, B, C, D, E, F)$ has FD set $S = \{A \rightarrow BC, CD \rightarrow E, C \rightarrow F, E \rightarrow F\}$
To compute A^+

- Start with $A^+ = A$, just $A \rightarrow BC$ matches, so $Y = BC$
- $A^+ = ABC$, just $C \rightarrow F$ matches, so $Y = F$
- $A^+ = ABCF$, no FDs apply, so we have the result

Closure of a set of attributes with a set of FDs

Closure X^+ of a set of attributes X with FDs S

1. Set $X^+ := X$
2. Starting with X^+, apply each FD $X_s \rightarrow Y$ in S where $X_s \subseteq X^+$ but Y is not already in X^+, to find determined attributes Y
3. $X^+ := X^+ \cup Y$
4. If Y not empty goto (2)
5. Return X^+

Closure of a set of attributes

Relation $R(A, B, C, D, E, F)$ has FD set $S = \{A \rightarrow BC, CD \rightarrow E, C \rightarrow F, E \rightarrow F\}$
To compute AD^+

- Start with $AD^+ = AD$, just $A \rightarrow BC$ matches, so $Y = BC$
- $AD^+ = ABCD$, $CD \rightarrow E, C \rightarrow F$ matches, so $Y = EF$
- $AD^+ = ABCDEF$, no FDs apply, so we have the result

Quiz 6: Closure of Attribute Sets

Given a relation $R(A, B, C, D, E, F)$ and FD set
$S = \{A \to BC, C \to D, BA \to E, BD \to F, EF \to B, BE \to ABC\}$

Which closure of attributes of S does not cover R?

A	B	C	D
A^+	BC^+	BE^+	EF^+

Closure of a set of Functional Dependencies

Closure of the FD Set

- The closure S^+ of a set of FDs S is the set of all FDs that can be inferred from S
- Two sets of FDs S, T are equivalent if $S^+ = T^+$
- For speed, we can ignore
  - trivial FDs (*e.g.* ignore $A \to A$)
  - LHS that are not minimal (*e.g.* ignore $AB \to C$ if $A \to$)
  - flatten all FDs to have just one attribute in RHS (*e.g.* consider $A \to CD$ as $A \to C$ and $A rightarrow D$)
- Apart from calculating equivalence, do not normally need to compute closure

Equivalent FDs

$S = \{A \to B, A \to C, B \to A, B \to D\}$
$T = \{A \to B, A \to C, A \to D, B \to A\}$
$S^+ = T^+ = \{A \to B, A \to C, A \to D, B \to A, B \to C, B \to D\}$
$\therefore S \equiv T$

Minimal cover of a set of FDs

Minimal cover S_c of S

A minimal cover S_c of FD set S has the properties that:

- All the FDs in S can be derived from S_c (*i.e.* $S^+ \equiv S_c^+$)
- It is not possible to form a new set S_c' by deleting an FD from S_c or deleting an attribute from an FD in S_c, and S_c' can still derive all the FDs in S

In general, a set of FDs may have more than one minimal cover

Deriving a minimal cover

Suppose $S = \{A \to B, BC \to A, A \to C, B \to C\}$

1 Since $B \to C$
$BC \to A \Rightarrow B \to A$
Leaves $S' = \{A \to B, B \to A, A \to C, B \to C\}$

2_a Since $A \to B, B \to C \models A \to C$
$A \to C \Rightarrow \emptyset$
Leaves $S_c = \{A \to B, B \to A, B \to C\}$

2_b Since $B \to A, A \to C \models B \to C$
$B \to C \Rightarrow \emptyset$
Leaves $S_c = \{A \to B, B \to A, A \to C\}$

Quiz 7: Minimal Cover of a Set of FDs

Given an FD set $S = \{A \to BC, C \to D, BA \to E, BD \to F, EF \to B, BE \to ABC\}$

Which is a minimal cover to S?

A

$A \to BC, C \to D, BA \to E, BD \to F, EF \to B, BE \to ABC$

B

$A \to BC, C \to D, BA \to E, BD \to F, EF \to B, BE \to A$

C

$A \to BCE, C \to D, BD \to F, EF \to B, BE \to A$

D

$A \to BC, C \to D, B \to E, B \to F, EF \to B, BE \to A$

Worksheet: Minimal Cover

$R(A, B, C, D, E, F, G, H)$

$S = \{AB \to DEH, BEF \to A, FGH \to C, D \to EG, EG \to BF, F \to BH\}$

1. Rewrite S to an equivalent set of FDs, which only have a single attribute on the RHS of each FD.
2. Consider each FD $X \to A$, and for each $B \in X$, consider if $X \to B$ from the other FDs. If so, replace $X \to A$ by $(X - B) \to A$ in S.
3. Consider each FD $X \to A$, and compute X^+ without using $X \to A$. If $A \subseteq X^+$, delete $X \to A$ since it is rundundant. This will give a minimal cover S_c of S.
4. Justify what are the minimal candidate keys of R constrained by S_c

Worksheet: Minimal Cover (Step 3)

1. $AB^+ = ABDEHGFC$
   Try removing $AB \to D$: find $AB^+ = ABEH$, so can't remove.
   Try removing $AB \to E$: find $AB^+ = ABDHEGFC$, so remove it from S'' to get S'''
   Try removing $AB \to H$: find $AB^+ = ABDEGFHC$, so remove it from S''' to get $S'''' = \{AB \to D, EF \to A, FG \to C, D \to E, D \to G, EG \to B, EG \to F, F \to B, F \to H\}$
2. $EF^+ = EFABHDGC$
   Try removing $EF \to A$: find $EF^+ = EFBH$, so can't remove.
3. $FG^+ = FGCBH$
   Try removing $FG \to C$: find $FG^+ = FGBH$, so can't remove.
4. $D^+ = DEGBFHAC$
   Try removing $D \to E$: find $D^+ = DG$, so can't remove.
   Try removing $D \to G$: find $D^+ = DE$, so can't remove.
5. $EG^+ = EGBFHADC$
   Try removing $EG \to B$: find $EG^+ = EGFBHADC$, so remove it from S'''' to get S'''''
   Try removing $EG \to F$: find $EG^+ = EG$, so can't remove.
6. $F^+ = FBH$
   Try removing $F \to B$: find $F^+ = FH$, so can't remove.
   Try removing $F \to H$: find $F^+ = FB$, so can't remove.
   Thus S''''' is a minimal cover

$S_c = \{AB \to D, EF \to A, FG \to C, D \to EG, EG \to F, F \to BH\}$

Normalisation

Formalise the intuition of redundancy by the statements of FDs

$\text{mid} \rightarrow \{\text{tdate}, \text{amount}, \text{no}\}$,
$\text{no} \rightarrow \{\text{type}, \text{cname}, \text{rate}, \text{sortcode}\}$,
$\{\text{cname}, \text{type}\} \rightarrow \text{no}$,
$\text{sortcode} \rightarrow \{\text{bname}, \text{cash}\}$
$\text{bname} \rightarrow \text{sortcode}$

1st Normal Form (1NF)

Every attribute depends on the key

Quiz 8: 1st Normal Form

bank_data

no	sortcode	bname	cash	type	cname	rate?	mid	amount	tdate

119	56	Wimbledon	84340.45	deposit	Poulovassilis, A.	5.50	1009	5600.00	1999-01-18

$mid \rightarrow \{tdate, amount, no\}$,
$no \rightarrow \{type, cname, rate, sortcode\}$,
$\{cname, type\} \rightarrow no$
$sortcode \rightarrow \{bname, cash\}$
$bname \rightarrow sortcode$

Is bank_data in 1st Normal form?

True

False

Prime and Non-Prime Attributes

Prime Attribute

An attribute A of relation R is **prime** if there is some minimal candidate key X of R such that $A \subseteq X$

Any other attribute $B \in Attrs(R)$ is **non-prime**

Prime and non-prime attributes of bank_data

bank_data(no,sortcode,bname,cash,type,cname,rate,mid,amount,tdate)

Has FDs mid $\rightarrow$ {tdate, amount, no}, no $\rightarrow$ {type, cname, rate, sortcode}, {cname, type} $\rightarrow$ no, sortcode $\rightarrow$ {bname, cash}, bname $\rightarrow$ sortcode

Then

1. the only minimal candidate key is mid
2. the only prime attribute is mid
3. non-prime attributes are no,sortcode,bname,cash,type,cname,rate,amount,tdate

3rd Normal Form (3NF)

3rd Normal Form (3NF)

For every non-trivial FD $X \rightarrow A$ on R, either

1. X is a super-key
2. A is prime

Every non-key attribute depends on the key, the whole key and nothing but the key

Failure of bank_data to meet 3NF

bank_data(no,sortcode,bname,cash,type,cname,rate,mid,amount,tdate)

- Has the following FDs where the LHS is not a super-key:
  no $\rightarrow$ {type, cname, rate, sortcode}, {cname, type} $\rightarrow$ no,
  sortcode $\rightarrow$ {bname, cash}, bname $\rightarrow$ sortcode
- Each of the above FD causes the relation not to meet 3NF since the RHS contains non-prime attributes

Quiz 9: Prime and nonprime attributes

Given a relation $R(A, B, C, D, E, F)$ and an FD set $A \to BCE, C \to D, BD \to F, EF \to B, BE \to A$

What are the nonprime attributes?

A

DEF

B

BC

C

CDF

D

CD

Quiz 10: 3rd Normal Form

Given a relation $R(A, B, C, D, E, F)$ and an FD set
$A \to BCE, C \to D, BD \to F, EF \to B, BE \to A$

Which decomposition is not in 3NF?

A

$R_1(B, D, F), R_2(A, B, C, D, E)$

B

$R_1(A, B, C, E, F), R_2(C, D)$

C

$R_1(A, B, C, E, F), R_2(C, D), R_3(B, D, F)$

D

$R_1(B, E, F), R_2(A, C, E), R_3(C, D)$

Lossless-join decomposition of relations

Lossless-join decomposition of a Relation

A **lossless-join** decomposition of a relation R with respect to FDs S into relations $R_1, \ldots, R_n$ has the properties that:

- $Attrs(R_1) \cup \ldots \cup Attrs(R_n) = Attrs(R)$
- For all possible extents of R satisfying S, $\pi_{Attrs(R_1)} R \bowtie \ldots \bowtie \pi_{Attrs(R_n)} R = R$

Lossless-join decomposition of bank_data

bank_data(no,sortcode,bname,cash,type,cname,rate,mid,amount,tdate)

- Has FDs mid $\rightarrow$ {tdate, amount, no}, no $\rightarrow$ {type, cname, rate, sortcode}, {cname, type} $\rightarrow$ no, sortcode $\rightarrow$ {bname, cash}, bname $\rightarrow$ sortcode
- Decomposing bank_data into
  branch $= \pi_{\text{sortcode,bname,cash}}$ bank_data
  account $= \pi_{\text{no,type,cname,rate,sortcode}}$ bank_data
  movement $= \pi_{\text{mid,amount,no,tdate}}$ bank_data
  satisfies the lossless-join decomposition property

Problems if not a lossless-join decomposition

If a decomposition of R into $R_1, \ldots, R_n$ is not lossless, then some tuples spread over $R_1, \ldots, R_n$ can result in phantom tuples appearing

$R(A, B, C, D),\ S = \{A \to B, B \to CD\}$

R			
A	B	C	D
1	1	2	6
2	2	3	4
3	3	3	5

⇨

R_1		
A	B	C
1	1	2
2	2	3
3	3	3

R_2	
C	D
2	6
3	4
3	5

⇨

$R_1 \bowtie R_2$			
A	B	C	D
1	1	2	6
2	2	3	4
3	3	3	5
2	2	3	5
3	3	3	4

Quiz 11: Lossless join decomposition

Given a relation $R(A, B, C, D, E, F)$ and an FD set
$A \to BCE, C \to D, BD \to F, EF \to B, BE \to A$

Which is not a lossless join decomposition of R?

A

$R_1(B, D, F), R_2(A, B, C, D, E)$

B

$R_1(A, B, C, E, F), R_2(C, D)$

C

$R_1(A, B, C, E, F), R_2(C, D), R_3(B, D, F)$

D

$R_1(B, E, F), R_2(A, C, E), R_3(C, D)$

Worksheet: Lossless Join Decomposition

1. $R(A, B, C, D, E)$ has the FDs $S = \{AB \to C, C \to DE, E \to A\}$. Which of the following are lossless join decompositions?
   1. $R_1(A, B, C), R_2(C, D, E)$
   2. $R_1(A, E, C), R_2(C, D), R_3(D, E)$
2. Derive a lossless join decomposition into three relations of $R(A, B, C, D, E, F)$ with FDs $S = \{AB \to CD, C \to E, A \to F\}$.
3. Derive a lossless join decomposition into three relations of $R(A, B, C, D, E, F)$ with FDs $S = \{AB \to CD, C \to E, F \to A\}$.

Generating 3NF

Generating 3NF

1. Given R and a set of FDs S, find an FD $X \to A$ that causes R to violate 3NF (i.e. for which A is not a prime attribute and X is not a superkey).
2. Decompose R into $R_a(Attr(R) - A)$ and $R_b(XA)$ (Note because the two relations share X and $X \to A$ this is lossless)
3. Project the S onto the new relations, and repeat the process from (1)

Note that step (2) ensures that the decomposition is lossless since joining R_a with R_b will share X, and $X \to A$

Canonical Example of 3NF Decomposition

Suppose $R(A, B, C)$ has FD set $S = \{A \to B, B \to C\}$

- The only key is A, and so $B \to C$ violates 3NF (since B is not a superkey and C is nonprime).
- Decomposing R into $R_1(A, B)$ and $R_2(B, C)$ results in two 3NF relations.

Example: Decomposing bank_data into 3NF

Bank Database as a Single Relation

bank_data(no,sortcode,bname,cash,type,cname,rate,mid,amount,tdate)
$S = \{\text{mid} \to \{\text{tdate, amount, no}\}, \text{no} \to \{\text{type, cname, rate, sortcode}\},$
$\{\text{cname, type}\} \to \text{no}, \text{sortcode} \to \{\text{bname, cash}\}, \text{bname} \to \text{sortcode}\}$

Since sortcode $\to$ {bname, cash} and sortcode is not superkey and bname, cash nonprime, we should decompose bank_data into

1. branch(sortcode, bname, cash) with FDs sortcode $\to$ {bname, cash}, bname $\to$ sortcode
2. bank_data$'$(no, sortcode, type, cname, rate, mid, amount, tdate) with FDs mid $\to$ {tdate, amount, no}, no $\to$ {type, cname, rate, sortcode}, {cname, type} $\to$ no

branch is in 3NF, but no $\to$ {type, cname, rate, sortcode} makes bank_data$'$ violate 3NF, so we should decompose bank_data$'$ into:

3. account(no, type, cname, rate, sortcode) with FDs no $\to$ {type, cname, rate, sortcode}, {cname, type} $\to$ no
4. movement(mid.amount, no, tdate) with FD mid $\to$ {tdate, amount, no}

The relations branch, account, and movement are all in 3NF

Preserving FDs during decomposition

FD preserving decomposition

A lossless decomposition of R with FDs S into R_a and R_b preserves functional dependencies S if the projection of S^+ onto R_a and R_b is equivalent to S

FD preserving decomposition

Suppose $R(ABC)$ with $S = \{A \to B, B \to C, C \to A\}$ is decomposed into $R_a(AB)$ and $R_b(BC)$.

- $S^+ = \{A \to B, A \to C, B \to A, B \to C, C \to A, C \to B\}$
- The projection of S^+ onto R_a gives $S_a^+ = \{A \to B, B \to A\}$
- The projection of S^+ onto R_b gives $S_b^+ = \{B \to C, C \to B\}$
- Note that the union S_u of the two subsets of S^+ (*i.e.* $S_u = S_a^+ \cup S_b^+$) has the property that $S_u = S^+$, and hence the decomposition preserves functional dependencies.

3NF

There is always possible to decompose a relation into 3NF in a manner that preserves functional dependencies. Thus any *good* 3NF decomposition of a relation must also preserve functional dependencies.

Quiz 12: Preserving FDs during Decomposition

Given a relation $R(A, B, C, D, E, F)$ and an FD set $A \to BCE, C \to D, BD \to F, EF \to B, BE \to A$

Which decomposition preserves FDs?

A

$R_1(B, D, F), R_2(A, B, C, D, E)$

B

$R_1(A, B, C, E, F), R_2(C, D)$

C

$R_1(A, B, C, E, F), R_2(C, D), R_3(B, D, F)$

D

$R_1(B, E, F), R_2(A, C, E), R_3(C, D)$

Preserving FDs, lossless join, and 3NF

Given a relation $R(A, B, C, D, E, F)$ and an FD set $A \to BCEG, C \to D, BD \to F, EF \to B, BE \to A$

Decomposition	lossless join	3NF	Preserves FDs
$R_1(B, D, F), R_2(A, B, C, D, E)$	✓	✗	✗
$R_1(A, B, C, E, F), R_2(C, D)$	✓	✓	✗
$R_1(A, B, C, E, F), R_2(C, D), R_3(B, D, F)$	✓	✓	✓
$R_1(B, E, F), R_2(A, C, E), R_3(C, D)$	✗	✓	✗

Decomposing to 3NF

Since it is always possible to decompose a relation into a 3NF form that is both a lossless join decomposition, and preserves FDs, you should always do so.

Quiz 13: Preserving FDs during Decomposition to 3NF

Suppose the relation $R(A, B, C, D, E)$ has functional dependencies $S = \{AC \to DBE, BC \to DE, B \to A, E \to D\}$ (and hence has minimal keys AC and BC)

Which is a lossless join decomposition to 3NF that preserves FDs?

A

$R_a(B, C, E), R_b(A, B, C), R_c(D, E)$

B

$R_a(A, B, C), R_b(A, C, D, E)$

C

$R_a(A, C, D), R_b(A, C, E), R_c(A, B)$

D

$R_a(A, C, E), R_b(B, D, E)$

Boyce-Codd Normal Form (BCNF)

Boyce-Codd Normal Form (BCNF)

For every non-trivial FD $X \to A$ on R, X is a super-key.

Every attribute depends on the key, the whole key and nothing but the key

BCNF schema

branch(sortcode, bname, cash) with FDs sortcode $\to$ {bname, cash}, bname $\to$ sortcode is in BCNF since sortcode and bname are both candidate keys

account(no, type, cname, rate, sortcode) with FDs no $\to$ {type, cname, rate, sortcode}, {cname, type} $\to$ no is in BCNF since no and cname, type are both candidate keys

movement(mid.amount, no, tdate) with FD mid $\to$ {tdate, amount, no} is in BCNF since mid is key

Decomposition of Relations into BCNF

Generating BCNF

1. Given R and a set of FDs S, find an FD $X \to A$ that causes R to violate BCNF (*i.e.* for which X is not a superkey).
2. Decompose R into $R_a(attr(R) - A)$ and $R_b(XA)$ (Note because the two relations share X and $X \to A$ this is lossless)
3. Project the S onto the new relations, and repeat the process from (1)

Difference between 3NF and BCNF

Suppose the relation address(no, street, town, county, postcode) has FDs
{no, street, town, county} → postcode, postcode → {street, town, county},

- The relation is in 3NF (alternative keys: no, street, town, county and no, postcode).
- The relation is not in BCNF since postcode → {street, town, county} has a non-superkey as the determinant
  - Decompose the relation address on postcode → {street, town, county} to:
    postcode(postcode, street, town, county)
    streetnumber(no, postcode)
  - Note FD {no, street, town, county} → postcode cannot be projected over the relations.

Worksheet: Normal Forms

$S_c = \{AB \to D, EF \to A, FG \to C, D \to EG, EG \to F, F \to BH\}$

1. Decompose the relation into 3NF
2. Decompose the relation into BCNF
3. Determine if your decompositions in (1) and (2) preserve FDs, and if they do not, suggest how to amend you schema to preserve FDs.
